Pyrrolo[3,2-c]quinoline derivatives containing haloalkoxy group and pharmaceutically acceptable salts thereof

Field of the Invention

5 The present invention relates to a novel pyrrolo[3,2-c]quinoline derivatives containing haloalkoxy group, their pharmaceutically acceptable salts; process for preparation thereof; and pharmaceutical composition thereof for treating gastric ulcer. More particularly, the present invention relates to novel pyrrolo[3,2-c]quinoline derivatives, as represented by Formula I, in which R₁ is

10 haloalkoxy group, which reversibly inhibit gastric acid secretion of mammal; their salts; and process for preparation thereof; pharmaceutical composition thereof is effective for treating gastric ulcer.

Formula I

15 in which R₁ is haloalkoxy group of C₁ ~ C₆ including trifluoromethoxy, difluoromethoxy and trifluoroethoxy group.

R₂ and R₃, which are the same or different, are each hydrogen, halogen, hydroxy, benzyloxy, alkyl group of C₁ ~ C₆, alkoxy group of C₁ ~ C₆.

A is -CH₂-CH₂- or -CH=CH-, and

R_4 is hydrogen, halogen, amino, alkylamino group of $C_1 \sim C_6$, and $NH(CH_2)_nOH$ in which n is $1 \sim 6$.

So far, benzimidazole derivatives containing pyridine as represented by the Omeprazole, commercial name, have been commonly used for inhibitor of gastric acid secretion. Benzimidazole derivatives containing pyridine have displayed a prominent remedial result, but have raised a problem in long term administration because of their irreversible reaction mechanism. That is, there have been sustained effect of medicine after stopping administration or side effect of thickening stomach wall by administration, etc.

In addition, quinoline derivatives have been known as the inhibitor of gastric acid secretion of mammal, and there have been attempts to develop them as a reversible inhibitor of gastric acid secretion. [European Patent No. 87-307824.0; USP 5,362,743; PCT KR 94-29274; European Patent No. 89-301801.0; European Patent No. 87-301805.1; European Patent No. 89-301802.8; European Patent No. 88-306583.1; PCT KR 97-00074; KP 96-38314; KP 97-30692; KP 97-30693; J. For example, European Patent No. 88-306583.1 describes pyrrolo[3,2-c]quinoline derivatives of the following structure.

Formula II

in which A is $-\text{CH}_2-\text{CH}_2-$, $-\text{CH}=\text{CH}-$ or $-(\text{CH}_2)_3-$,

- 5 R₁ to R₄ are each hydrogen, halogen, alkyl group of C₁ ~ C₄, alkoxy group of C₁ ~ C₆, phenyl group, alkylthio group of C₁ ~ C₆, alkanoyl group of C₁ ~ C₄, alkylamino group of C₁ ~ C₆, dialkylamino group of C₁ ~ C₆, trifluoromethyl or nitro group.

- R₅ to R₉ are each alkyl of C₁ ~ C₆, alkoxy group of C₁ ~ C₆, alkylthio group of C₁ ~ C₆, halogen, cyano, amino, hydroxy, carbamoyl, carbonyl, alkanoyl group of C₁ ~ C₆, trifluoromethyl or nitro group.

R₁₀ is hydrogen, halogen, alkyl group of C₁ ~ C₆, alkoxy group of C₁ ~ C₆, alkylthio group of C₁ ~ C₆, hydroxy group, $-\text{CH}_2\text{OH}$, $\text{NR}_{11}\text{R}_{12}$ or $\text{NH}(\text{CH}_2)_n\text{OH}$ in which n is 0 to 4.

15

Above-mentioned literature described that compound of Formula II and their salts play a role as the inhibitor of gastric acid secretion by inhibiting H^+/K^+ -

ATPase enzyme in stomach, and are useful for treating gastric disease in mammal, particularly in human.

Another literature (*J. Med. Chem.*, 1992, 35, 1845 ~ 1852) about 1-arylpyrrolo[3,2-c]quinoline derivatives as a reversible inhibitor of gastric acid secretion, described particularly effect of substituent R₁₀.

There have been some reports of 1-arylpyrrolo[3,2-c]quinoline derivatives in which R₁ is substituted with alkoxy group, but no report with haloalkoxy group. We, the inventors of the present invention, synthesized novel 1-aryl-6-haloalkoxypyrrolo[3,2-c]quinoline derivatives in which R₁ was substituted haloalkoxy group, and found that they showed excellent effect on gastric ulcer by reversibly inhibiting the gastric acid secretion.

20 position with haloalkoxy group, of structure (II).

1-Aryl-4-oxo-6-haloalkoxy-4,5-tetrahydropyrrolo[3,2-c]quinoline derivatives in which A is unsaturated -CH=CH-, of structure (V_b) can be prepared by oxidizing the 1-aryl-4-oxo-6-haloalkoxy-2,3,4,5-dihydropyrrolo[3,2-c]quinoline
25 of structure (V_a) in the presence of Pd catalyst, etc.

As shown in the following Scheme II , pyrrolo[3,2-c]quinoline derivatives

of structure (I_a) in which A is saturated -CH₂-CH₂-, can be prepared by chlorinating the 4-position of structure (V_a), then substituting chlorine in 4-position with R₄.

And, as shown in the following Scheme III, pyrrolo[3,2-c] quinoline derivatives of Structure(I_a) containing haloalkoxy group in which A is unsaturated -CH=CH-, can be prepared by chlorinating the 4-position of compound (V_b), then substituting chlorine in 4-position R₄.

Process for preparation of pyrrolo[3,2-c]quinoline derivatives having haloalkoxy group, of Formula I, will now be described in detail with reference to the Schemes showing embodiments thereof.

In the process for preparation of pyrrolo[3,2-c]quinoline derivatives of Formula I, intermediate may be different according that A is -CH₂-CH₂- or -CH=CH- in the Formula I.

Also, process for preparation of pyrrolo[3,2-c]quinoline derivatives may be different in accordance with their substituents. Firstly, process for preparation of intermediate, used for preparing the pyrrolo[3,2-c]quinoline derivatives, will now be described in detail with reference to the Scheme I, as follows:

Scheme I

in which substituents R_1 , R_2 , R_3 and R_4 are each defined as above.

- 5 1) 4-oxo-6-haloalkoxy-2,3,4,5-tetrahydrofuro[3,2-c]quinoline compound (III) can be prepared by condensation of aniline of structure (II), substituted in ortho-position with haloalkoxy group, and diethyl 2-ethoxyethylmalonate by the common method [J. Chem. Soc., 1995, 4284; J. Med. Chem., 1992, 35, 1845]. In this reaction, it is preferable that diethyl 2-ethoxyethylmalonate is used about 1 ~
 10 3 equivalents to the above aniline compound, that diphenyl ether is used as reaction solvent, and that reaction is maintained at 200 ~ 270 °C for 24 ~ 72 hours. Additionally, rate and yield of reaction can be improved by removing the alcohol formed during the reaction with Dean-Stark apparatus.

- 15 2) 1-Aryl-4-oxo-6-haloalkoxy-2,3,4,5-tetrahydropyrrolo[3,2-c]quinoline compound (V_a) can be synthesized by the process for preparation, described in the literature [KP 96-16624, PCT KR 97-00074]. Compound (V_a), that is, can be

prepared by refluxing the 4-oxo-6-haloalkoxy-2,3,4,5-tetrahydrofuro[3,2-c]quinoline compound (III) with the above aniline compound (IV), in which benzene ring has substituent R_2 and R_3 , under inert atmosphere, such as nitrogen. In the reaction, 1 ~ 3 equivalents of aniline compound, as represented by structure

It is preferable that reaction is maintained at 150 ~ 280 °C for 7 ~ 20 hours and carried out under inert atmosphere, such as nitrogen. If the reaction is carried out under atmosphere including oxygen, oxidized compound can be formed as by-product. In addition,
